

- 1) Measure both the width and the length of every window.
- 2) Measure with a steel tape measure.
- 3) Ensure that your measurements are made to the nearest 1/8".
- 4) Both dimensions should be given in total inches. i.e. 5'4" equals 64"
- 5) Measure the window exactly, do not take deductions for inside mount installations.
- 6) Inside Mount means that the shade/blind will be mounted inside the window casing.
- 7) An Outside Mount blind/shade is mounted outside the window casing. Include in the notes if there is any trim/molding/framing and its dimensions.
- 8) Please note if there is a preference for the side of the stack and the controls. This only applies to vertical blinds.
- 9) Take into consideration the depth of the window if an inside mount installation is planned.
- 10) On outside mount installations, is there any reason we cannot add to the width and/or length of your blind/shade?
- 11) If there are any doubts, feel free to include a drawing with the measurement form.
